

CABLE SUPPORT APPARATUS FOR A RAISED FLOOR SYSTEM

Abstract of Disclosure

A cable support apparatus for a raised floor system comprising at least one support member. The at least one support member is configured to be mounted to a pedestal of the raised floor system and connect with portions of cable trays. The support member, in one preferred embodiment includes a first member and a second member, each defining a slot for positioning on the support pedestal. The support member also includes a plurality of holes for the securing of the first member and the second member together as well as for connecting with cable trays. The cable trays are attached to the support member with an attachment mechanism such as a threaded stud.
